

The package **P-Pack**

produced by **REV Packaging Solutions' Puma Packaging machine for thermosealed nets**, is born from the need of replacing the metal clip with an option guaranteeing a packaging for fruit and vegetables which may be as simple and lightweight and thus cheap for both the consumer and the packager, but with a lesser environmental impact, that is to say, which is easily recyclable.

REV, thanks to a long experience in the field of heat sealing, projected and tested over years a packaging which is fully in PE, made of thermosealed tubular net, with a tape functioning as a handle and a label, wineglass or weld-to-weld (sealed at the extremities).

The label on which to print all product information, customisable in shape and size, ensures a wide space for communication. The result is a package which is attractive and, above all

monomaterial

100%

recyclable

Moreover, Puma is equipped with a thermal transfer printer able to print directly on the label, also in polyethylene.

This allows to reduce to a minimum the weight of the package: overall, with respect to traditional thermosealed bags, P-Pack is made with

50% less
plastic!

- totally in PE
- with no metal clip
- fully recyclable (plastic collection)
- it maintains the shape and advantages of traditional nets with clip
- practical and easy to handle
- two different types of label, wineglass or weld-to-weld, with a wide space for communication
- it is **the lightest, cheapest and most ecological** thermosealed net on the market!

Here is a comparison, for a 500 g package (of lemons, for instance), between the weight (in grams) of P-Pack and of the thermosealed nets (for dried fruit, citruses, onions, potatoes, etc.) currently on the market:
